

# Leaphy Original Workbook

Leaphy Easybloqs software

**LEAPHY**  
Robotica voor iedere leerling

# Leaphy Original - Workbook - Introduction

## **How does this book work?**

This book contains lessons for the educational robot Leaphy Original. The lessons are divided into levels. Each level introduces new skills and knowledge. In this way you will become familiar with robotics step by step.

## **Do not panic**

Leaphy doesn't always do what you want right away. That's why you can learn so much from it. So:

Just try it. Make mistakes calmly and solve them again. That way you'll get further every time.

## **Tips and solutions**

Are you really stuck at a level?

You can find tips from other Leaphy builders on the Leaphy forum: [forum.leaphy.nl](http://forum.leaphy.nl).

The red solution booklet also contains sample programs that will help you get back on track.

## **Arduino Technique**

The Leaphy robot works with an Arduino mini computer. Arduino is used by professional designers and engineers around the world. Use it carefully and you will enjoy it for a long time.

And now: let's get started....enjoy it!

The team of the Leaphy Foundation

*Robot design Leaphy Original: Olivier van Beekum, Vroukje van der Vliet & Hannah Kersbergen*

*Teaching material - concept and elaboration: Roeland Smith*

*Translation: Nora van Wassenaer, Myrthe Smith, Olivier van Beekum and Tracy Nkongolo*

*Fifth edition - February 2021 © Stichting Leaphy*

# Level 1 – Building and Programming

Build your Leaphy Original with the instruction film on the Leaphy Original Building page at [www.leaphy.nl](http://www.leaphy.nl). Then program your Leaphy Original using the levels from this workbook.

## Level 1.0 – Software Setup

- Install Leaphy Easybloqs ([www.leaphy.nl](http://www.leaphy.nl))
- Security block on PC? See instructions on website.
- Start Easybloqs and choose 'Leaphy Original'.

## Level 1.1 – Five types of programming blocks

You will find them all in this workbook. Would you like to know in advance what will come? Here they all are together with a short explanation.

The main program: everything that you put here will be uploaded to your robot.

Green number blocks: With these you can compare sensors and numbers. From level 1.

You can also use this to calculate.

Yellow thinking step blocks: Clarity in your program. In what order does everything happen? And how long and until what new occurrence should something go on? From level 1.

Blue green robot blocks: with these you can give direct orders to your robot. These will also get you the information from the sensors. From level 1.

Lightblue blocks: Here you can add the pieces of your program that you use more often. with one simple block.

There's a 'die' with the light green blocks. You will see that in level 3.

You can make your own variables. In level 3 you will learn why that's useful and how it works.

# Level 1 – Building and Programming

## Level 1.2 – Watching Code

By pressing the round button at the top right, you will see the code that will soon be placed on your robot.

```
#include "Leaphyoriginal1.h"

void leaphyProgram() {
  while (true) {
    setMotor(9, 100);
  }
}

void setup() {
  leaphyProgram();
}

void loop() {
}
```

## Level 1.3 – Upload Code

Connect your Leaphy with the USB cable. Press the 'upload to robot' button.

Easybloqs will now check which USB port your robot is connected to and upload the code.

Older Windows versions may require a driver to be installed. Easybloqs does that for you. You will receive a notification, press 'Ok' and afterwards on the cross. In principle, Apple already has the correct drivers. It doesn't work? Check [leaphy.nl](http://leaphy.nl) for tips.

Is the upload really not working? Check (possibly with a system administrator) whether the USB ports are open (sometimes these are closed for security reasons). Leaphy is not dangerous...

## Level 1.4 – Clearing Blocks

Blocks are quickly thrown away with 'delete'.

You can also drag them all the way to the left, until the hand becomes a red cross.

You cannot throw the main Leaphy block away. The box at the bottom right is a kind of treasure chest: what you keep in it, you can retrieve later.

# Level 2 – Shine & Drive

The Leaphy has as RGB LED: a light with red, green and blue. You can mix all colors with it. Leaphy can also drive and dodge objects with its motors and the ultrasonic distance sensor. In this level you will learn how to work with this.

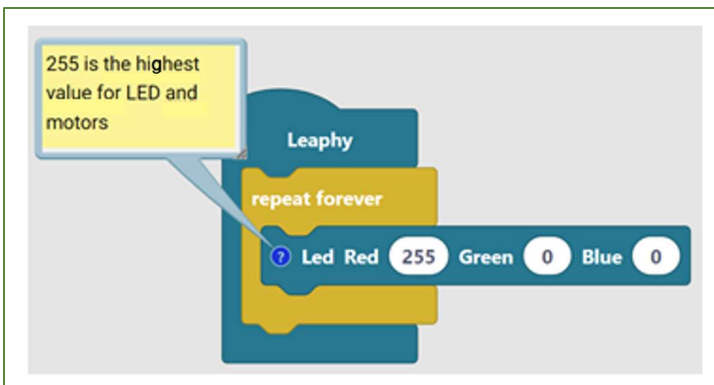

## Level 2.1 – Testing Colors

Create and upload this program. This is how you test the red light. Is it not right?

Shield	RGB-LED
Gnd	- (Minus)
3	B (Blue)
5	G (Green)
6	R (Red)

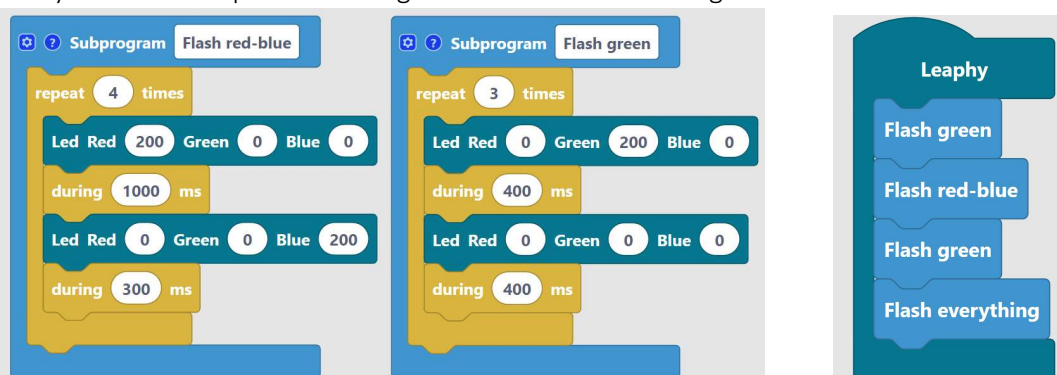

Reconnect:

Test Green and Blue as well.

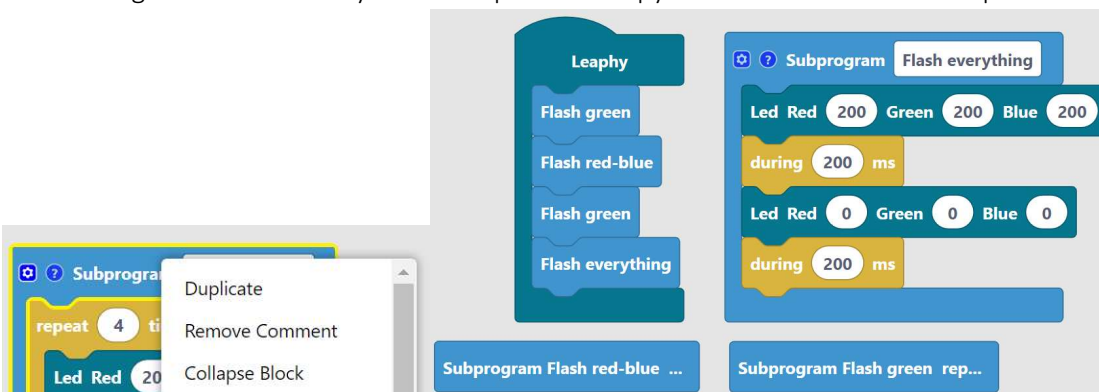

## Level 2.2 – Light show

Make flashing blocks with the Own Blocks and make a light show with them. Think of more for yourself. Can you also make pink? Or orange? Also check out [www.rgbcolorcode.com](http://www.rgbcolorcode.com).

With the right mouse button you can 'duplicate' = copy blocks. You can also 'collapse' blocks.

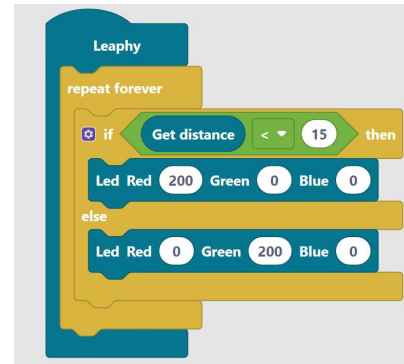

# Level 2 – Shine & Drive

## Level 2.3 - Distance sensor

With this program you can see the measurements of the distance sensor at the bottom right of your screen. Press the round Code button if you don't see them!  
(Oh yes, the USB cable has to be in there.)  
Do you only see 1313? Then your sensor is not working properly.

- Check in the diagram whether you have connected the wires correctly.
- Make sure the wires in the breadboard are right behind the sensor pins.
- Press the shield firmly.
- Test it with another sensor.

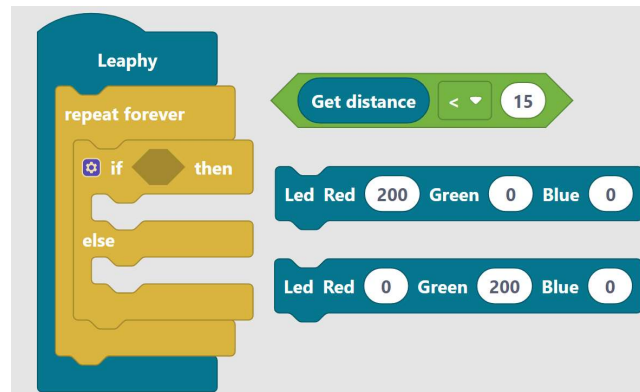

Shield – gele pinnen	Afstandsensor
+ plus	Vcc
R eturn	Trig
T rigger	Echo
G round	GND

## Level 2.4 – Alert!

Make a program where the light changes color when you place your hand in front of it.

Handy for later: save your program!

## Level 2.5 – Alarm in three steps

Use the blocks below to create a program that does the following:

Is there nothing in front of the sensor?

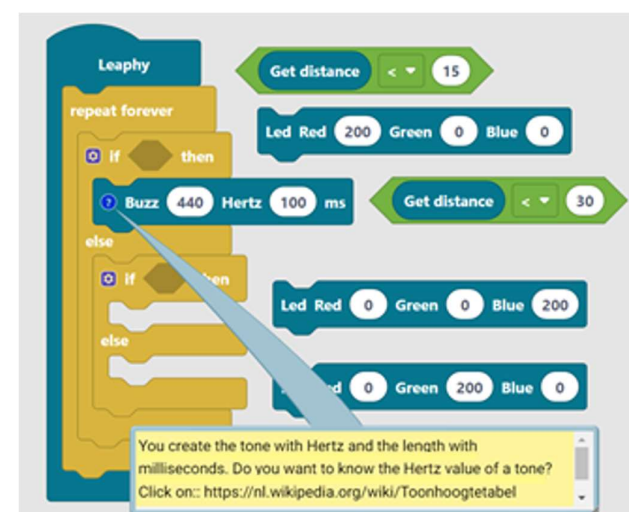

Green light!

Does something come within 30 centimeters?

Blue light!

Does something come within 15 centimeters?

Red light with a short 'buzz'.

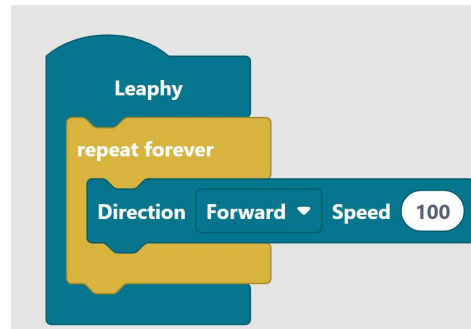

## Level 2 – Shine & Drive

### Level 2.6 - Engine Control

Put this program on your Leaphy. Then turn the switch 'ON'. Does the Leaphy drive with his sonar eyes forward? In that case the wires are right.

Is a motor turning the wrong way? Then switch the black and red wire of the motor on the shield.

### Level 2.7 - Reverse at Danger

Create a program:

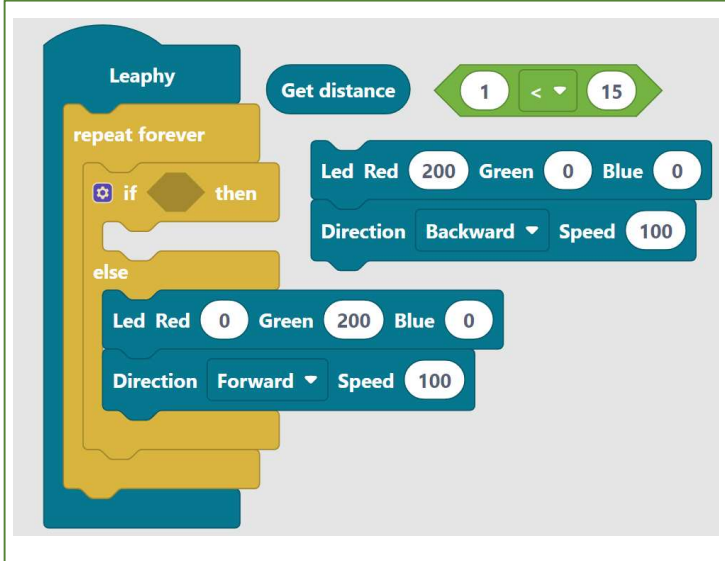

Drive forward when there is no danger.

Back in danger.

Enter by yourself at how many centimeters Leaphy should 'scare'.

Use the program from level 2.4.

Now add engine blocks. You can just leave the LED blocks.

### Level 2.8 – Driving and Dodging

Driving backwards only helps against crashing a little bit. Leaphy also has to make a turn after reversing in able to get away. For this, give the blocks on the right a good place in the program from level 2.7.

Think by yourself where they should be.

You can adjust the length of the time blocks to get different effects.

# Level 3 – Robot with Character

Animals are surprising and unpredictable, so they are fun to watch.  
In this level you will also give character to your Leaphy by making it unpredictable.

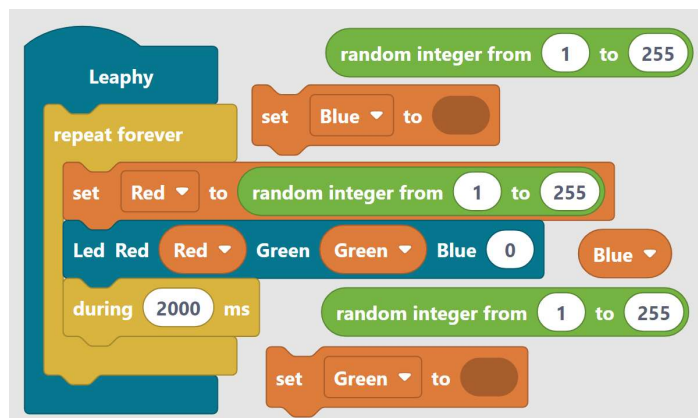

## Level 3.1 - Random colors 1

Create the variable 'Red' by yourself under 'Variables'.  
Also create 'Green' and 'Blue'.

## Level 3.2 - Random Colors 2

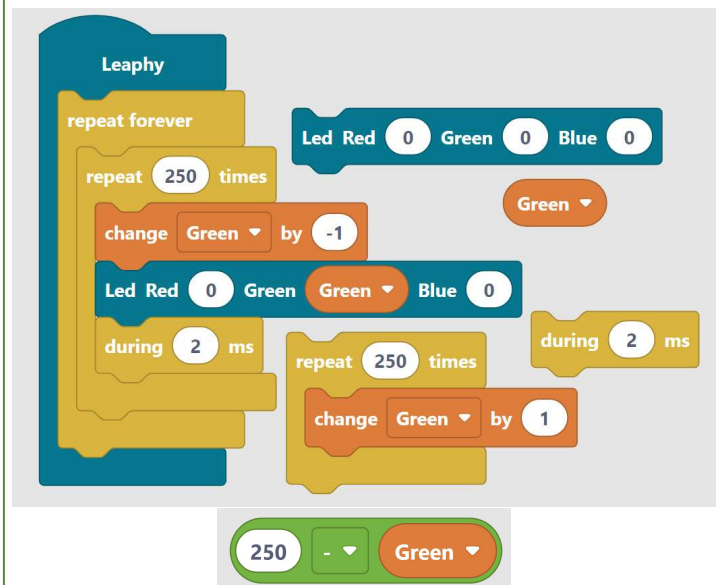

Now create a program that makes a new color every two seconds.  
What colors do you see coming by?

## Level 3.3 - Color Wave

Variables also allow you to create colors that light up gently.  
You can see that right here.  
Now make sure with the other blocks that it also goes out softly. And on again. And out again.  
Experiment with the waiting time for good results.

If you now paste the calculation block on the right in one of the other colors, you will see that that color switches on and off exactly the other way around.

# Level 3 – Robot with Character

## Level 3.4 – Random Driving Speed

Use the program from level 2.7 and also the blocks on the right.

Have Leaphy back up at random speeds each time.

After each dodge action, have Leaphy move forward again at any speed.

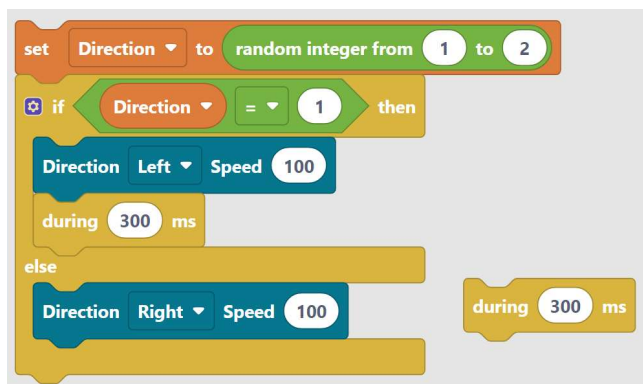

Also make the rotation speed random.

## Level 3.5 - Random left or right 1

Let Leaphy randomly pick a side to turn to: left or right.

To do this, add the blocks on the right in the right place to the avoidance program from level 2.7.

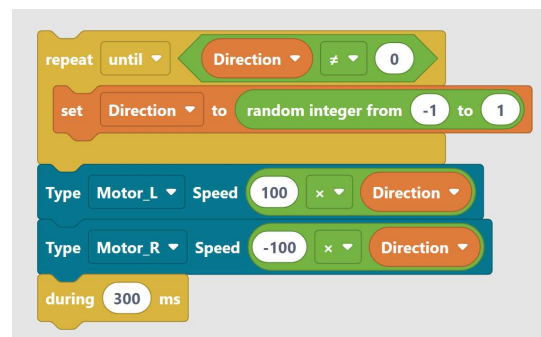

## Level 3.6 - Random left or right 2

There is also another way to make your Leaphy randomly turn in one direction. To do this, you can use a trick from mathematics.

Try placing the blocks on the right in your avoidance program.

Don't forget to add a waiting time as well.

## Level 3.7 - Random Wait

You'll notice: the waiting time is important for the behavior of your robot. You can also make the waiting time arbitrary.

With a calculation trick you can ensure that it builds up nicely in steps of 100 milliseconds, so that it really stands out.

# Level 4 – Line Followers

Leaphy can use different sensors. In this level you will learn how to work with active infrared sensors: they emit light and measure how much light is reflected. In this way Leaphy can follow a line.

## Level 4.1 – Confirm sensors

On [www.leaphy.nl](http://www.leaphy.nl) you will find an instructional video for attaching the line followers. Try without a video? That's fine! Click, screw in. Ready. The connection diagram of the cables can be found at level 4.2.

Tip: If you have a thin line, you can attach the sensors closer together. That way it drives even smoother!

## Level 4.2 – Connecting sensors

The video shows how to connect the sensor. Use a set of three female-female threads per sensor.

To be sure, the schedule is shown to the right. Always read carefully what is stated with the pins. You connect the sensors to the first two rows of 'black-red-white'.

Shield	Connect	Line follower
	Black Gnd pin >>>>>>>>	GND
	Red 5+ pin >>>>>>>>	VCC
	White communication pin >>>>>>>>	OUT

## Level 4.3 – Testing the Line Follow Sensor

The line follower works as soon as it receives power. Even without a program. The light blue LED emits infrared light. If it hits a light-colored surface, it bounces back to the black receiver. You can see it on the sensor itself: a very small red LED lights up. Test it with your hand or a sheet of white paper.

# Level 4 – Line Followers

## Level 4.5 – Reading the line followers

Drag two digital reading blocks to the programming field. One for each sensor.  
Now enter the correct pin numbers. The left sensor is -if it's good- on the first white pin. That's digital pin 14.  
And the right sensor is next to it on digital pin 15.

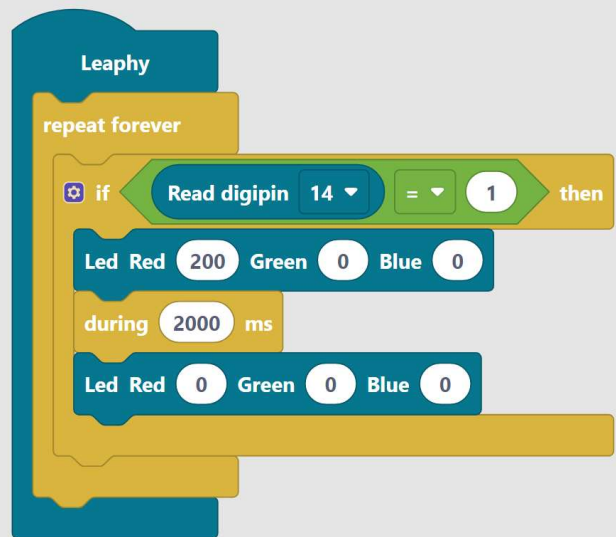

## Level 4.6 – Let's read!

The line-following sensors are 'digital'. That means they can only give two types of signals. Does the red sensor LED turn on? Then it sends a 1 to the white signal pin on the Leaphy. Does the sensor see black or nothing? Then a 0 goes to the Leaphy.  
**1 = True = YES** The light does reflect back, so the sensor sees a light-colored surface.  
**0 = False = No** The light does not reflect, so the sensor sees a black surface or air.

## Level 4.7 – Leaphy LED responds to sensors

Use the program on the right to test whether the sensor on digital pin 14 works well with your Leaphy.

Test the sensor on digipin 15 with this program.  
The value of the sensor, together with the X sign, immediately turns the LED on and off, without the If-Then block.  
Mathematics makes your code shorter!

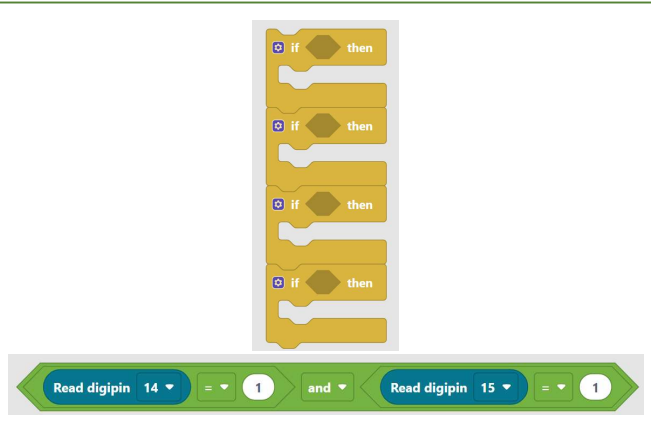

# Level 4 – Line Followers

## Level 4.8 - Important Blocks

You have two sensors that can both indicate 1 or 0. That gives four situations:

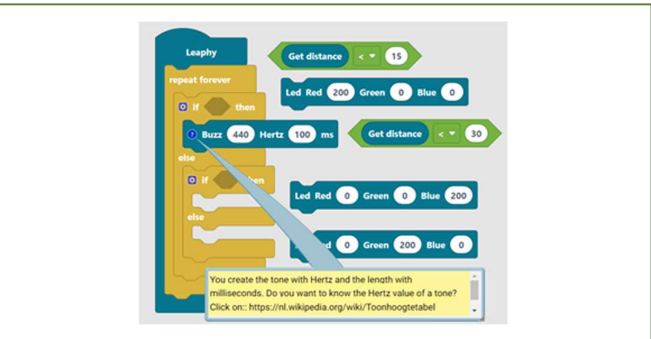

- |                     |                     |
|---------------------|---------------------|
| 1) Left 0 & right 0 | 3) Left 1 & right 1 |
| 2) Left 0 & right 1 | 4) Left 1 & right 0 |

Therefore, use four IF-THEN blocks.  
Your Leaphy must always respond to two signals at the same time. Use the AND block for this.

## Level 4.9 – Four situations with four LED colors

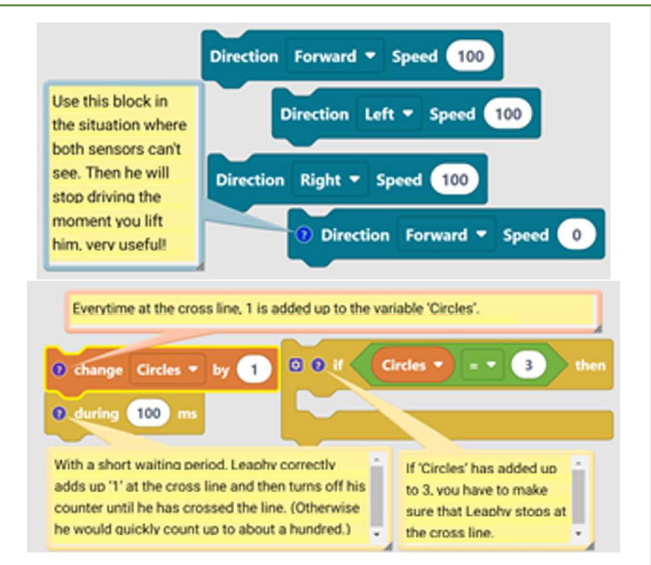

Use four IF-THEN blocks and the AND blocks to create a program that gives the LED a different color in each of the four situations (see level 4.8).

## Level 4.10 – Follow the Line

1. Have Leaphy trace a black line of tape over a white surface. Use level 4.9.
2. Now make a thick cross line on the line. Make Leaphy stop here.
3. Have Leaphy do three laps and then stop at the stop line. Create a variable for that.

**Tip:** save your programs for later!

## Help! The sensors do not see the line!

Are the sensors not responding to the line? Sometimes this is due to infrared light from the sun or bright lamps. You can shield the sensors a bit with tape on the bumper of your Leaphy. Also, the distance to the line may be a little too small. You can turn the tail key (short piece below) or take it out. So have fun thinking! (See also forum.leaphy.nl!)

# Level 5 – Light Sensors

In this level you will learn how to work with light sensors; those are light-sensitive resistors. The more light hits them, the greater the current they let through. You can make Leaphy ride towards the light.

## Level 5.1 – Check First!

What type of sensor do you have? Sometimes the Leaphy Foundation receives slightly different types of light sensors. You have to connect it differently. So pay close attention! Also watch the instruction video on the construction page of the Leaphy Original: [www.leaphy.nl/leaphy-original](http://www.leaphy.nl/leaphy-original)

Type 1

Type 2

## Level 5.2 – Attaching sensors

Make holes in the top with an awl or a small drill and screw the light sensors onto your Leaphy. Have them both look slightly diagonally to the side.

## Level 5.3 – Connecting sensors

Slide a set of three wires per sensor onto the row of black-red-white pins of the Shield. Then slide the ends onto the sensor pins. Use the column of your sensor type!

Shield	Type 1	Type 2
Black Gnd pin	Middle pin	Middle pin
Red 5+ pin	- (Minus)	S
White communication pin	S	- (Minus)

Line follower left  
Line follower Right

## Level 5.4 – Reading sensors

The light sensors are analog and not digital (like the line followers)

You use the same white communication pins, but there are two things that go differently:

1. You use the analog reading blocks.
2. You use the analog pin numbers.

On the right you can see an overview of the pin numbers. This is useful if you want to use more sensors (or servo motors) later on.

	Read analogue	Read digital	Control digitally
5	5	19	19
4	4	18	18
3	3	17	17
2	2	16	16
1	1	15	15
0	0	14	14

# Level 5 – Light Sensors

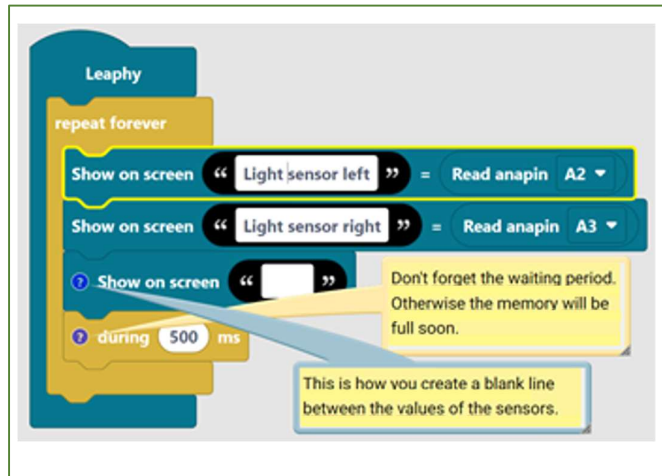

## Level 5.5 – What are we measuring?

The light sensors are analog. They provide much more information than digital sensors.

On the Leaphy these are values between 0 and 1024.

Test with this program whether your sensors work.

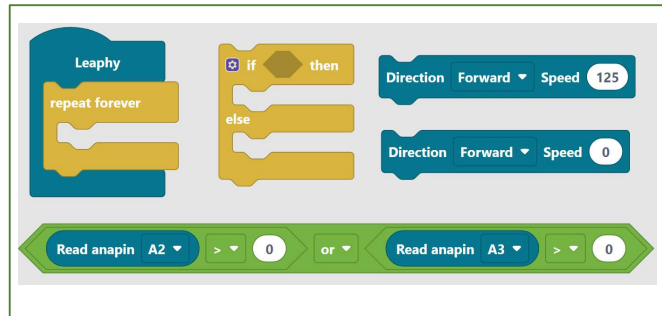

And in which light you get which values.

## Level 5.6 – Leaphy light sensitive

Create a program in which Leaphy will drive when you shine a flashlight on one of the sensors.

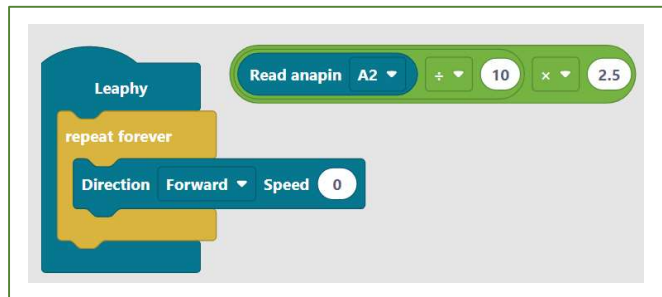

Enter a 'threshold value' yourself.

## Level 5.7 – Light makes you go faster

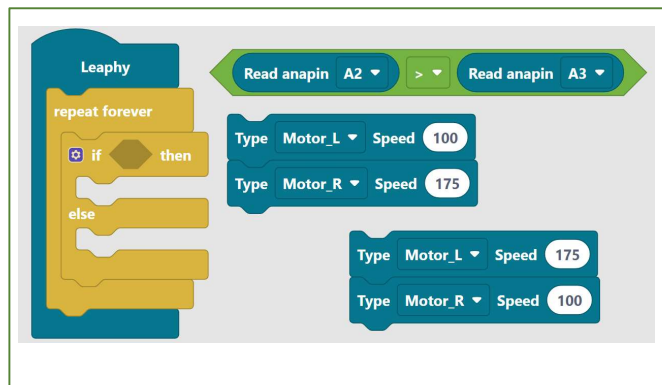

Create and link the variable 'Speed' to the value of the light sensor on pin 2. Your Leaphy will go faster when it gets lighter!

Challenge: can you incorporate this idea into the dodge program from level 2.8?

## Level 5.8 – Light Follower

You can make Leaphy drive towards the light by comparing the values of the two sensors and giving the left and right motors different speeds. Does it work? Does he also follow a flashlight? And: Can you also let him drive into the dark?

# Level 6 – Line Train

Using the sonar, you can equip a line-following Leaphy with an anti-collision system. However, the danger is that Leaphy loses the line during braking. So a nice challenge!

## Level 6.1 – Line Follower – Basic

Create a line follower like in level 4.10

## Level 6.2 – Anti-collision System 1

Now when Leaphy approaches a slower Leaphy on the line, you'll want him to stop for a moment. But he must stay on the line.

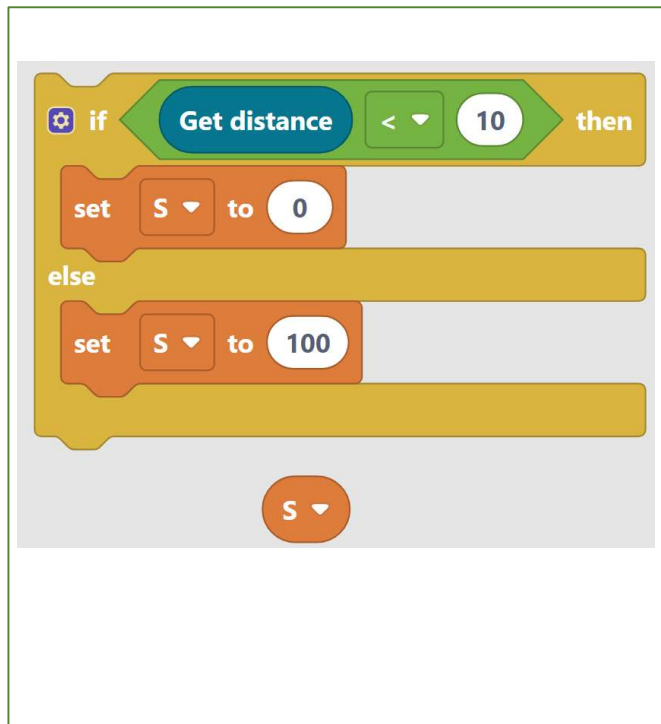

The steering function must therefore remain on and the forward drive function must be switched off for a while.

This can be done with a variable for the speed. We call it "S".

Place this program part in a logical place in the line follower program from level 4.10.

Now add the variable 'S' in the correct motor command block. Does it work? You may need to point the sonar slightly at the frame of the Leaphy in front.

Or you put a small 'screen' on the Leaphy in front of you to reflect the sound waves

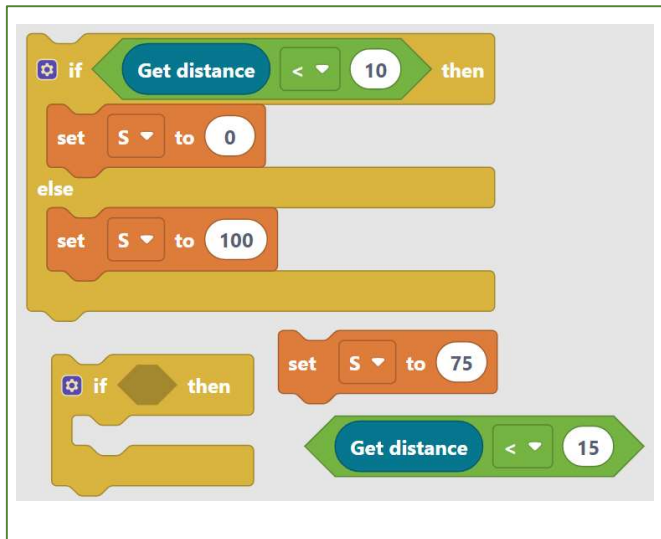

## Level 6.3 – Anti-collision System 2

You can see that the Leaphy now stops completely when there is a risk of collision.

Can you just slow him down a bit?

Or: slow down at 15 centimeters and stop at 10 cm?

# LEAPHY NEXT LEVEL?

Unfortunately! That was the last level...or was it?

No! Because the Leaphy Foundation regularly publishes new levels for your Leaphy Original online.

You can find them at **[www.leaphy.nl](http://www.leaphy.nl)**!

You will also find nice expansion sets for a few euros!

Proud of your Leaphy? Post a video on the Leaphy forum: [forum.leaphy.nl](http://forum.leaphy.nl)

There you will also find tips and nice ideas from others.

Have lots of fun!

The team of the Leaphy Foundation
